

Methodological notes

1. **Data source:** Annual statistical survey „*Water supply, in 2017*”
2. **Scope:** The statistical survey addresses all units whose main economic activity is water collection, treatment and supply (CANE Rev.2 division code: 36), local government units (CANE Rev.2 class code: 8411) which also supplied water to economic operators with abstraction licenses for water flows over 100 l/s.

3. Definitions

Public water supply network refers to the public network for district water supply operated by units specialised in water collection, treatment and supply.

Population connected to the public water supply network represents the totality of persons who benefit of the connection to the public network for district water supply.

Hydrographic basin represents the area of lands on which all the surface leaks flow in a sequence of currents, rivers and possibly lakes towards the sea through a river with a single mouth, estuary or delta.
